Dedicatoria

Este trabajo está dedicado a mi madre Gloria Cuellar, quien a pesar una ser una buena mujer, la vida no la trato bien. Que en paz descanse.

Resumen

En convenio entre la Escuela Colombiana de Ingeniería y la universidad de Purdue (USA) se propuso desarrollar el trabajo académico, cuyo objetivo principal fue determinar los índices de sobre esfuerzo y cálculo de deformaciones bajo la carga del camión de diseño HL-93 y la Norma AASHTO 2012, para la superestructura de dos puentes vehiculares, localizados en el estado de Indiana Estados Unidos, diseñados y construidos bajo la norma AASHTO de 1949.

Los puentes en estudio llevan en servicio 69 y 61 años respectivamente, siendo el más antiguo el que se denominó como puente No 1, cuya superestructura está compuesta por seis vigas de sección T en concreto reforzado y de una luz. El otro puente se nombró para el estudio como puente No 2, su superestructura está compuesta por una losa maciza continua dividida en tres luces.

El trabajo aquí realizado se desarrolló en cuatro etapas; En la primera, se realizó un estudio de la norma AASHTO 2012, además de la información suministrada por universidad de Purdue, la cual consistió en veintitrés (23) planos en formato PDF, copia de los originales de diseño e intervenciones realizadas a los puentes. En la segunda etapa se transcribió la información relevante de los planos de diseño a Autocad.

Una vez estudiado y entendido los requerimientos exigidos en la norma AASHTO 2012, para el diseño de puentes más la información obtenida de los planos de diseño, se procedió con la tercera etapa, la cual consistió en determinar las solicitaciones por corte y flexión para la superestructura de los dos puentes. Las solicitaciones se calcularon manualmente y con la ayuda del programa SAP2000, esto último para tener un punto de comparación de resultados, los métodos empleados para determinar las solicitaciones manualmente fueron el teorema de Barret para el puente No 1 y líneas de influencia para el puente No 2.

En la cuarta etapa, se calcularon los índices de sobre esfuerzo por corte y flexión, así como las deformaciones de los puentes. Obteniendo índices por flexión para el puente No 1 hasta un 16% por encima de la capacidad de las vigas, según requerimientos de la norma, además de no cumplir los límites para deformaciones. En el puente No 2 se obtuvieron índices de sobre esfuerzo por corte y flexión por debajo de la capacidad de

resistencia de los elementos. Concluyendo que el puente No-1 a pesar de obtenerse índices superiores a la unidad, el puente puede seguir en funcionamiento y el puente No-2 cumple con los requerimientos de capacidad establecidos en la Norma AASHTO 2012.

Introducción

En el desarrollo económico, social, cultural y productivo de una sociedad existen diferentes factores, que juegan un papel muy importante. Uno de estos entre muchos otros, es el estado de conservación de las vías de comunicación y sus componentes tales como: bermas, señalizaciones, calzadas, andenes, cunetas túneles, viaductos y puentes. Una vía en buen estado se traduce para una sociedad en; reducción en tiempos de viaje, facilita el desplazamiento de los usuarios y mercancías, además de contribuir al desarrollo y sostenibilidad económica de las regiones entre otros.

Actualmente, uno de los ítems que mide a nivel mundial el desarrollo de una nación es el estado de conservación de sus vías de comunicación, por otro lado una vía para una nación es una inversión productiva, con el reintegro de los costos invertidos en tiempos relativamente rápidos, seguros y bien multiplicados.

Ninguna nación o sociedad crece con un defectuoso sistema de vías, por lo tanto para que una vía preste la función básica para la cual fue proyectada y no margine o retrase el desarrollo de una región, es indispensable implementar un plan mantenimiento periódico para esta y para cada uno de los elementos que la componen.

Cuando se habla de una vía, dependiendo de la topografía que atravesase, esta puede estar compuesta por diferentes elementos, los cuales también se deben tener en cuenta en el momento de realizar un mantenimiento o una ampliación vial, tal es el caso de los puentes vehiculares, los cuales son elementos estructurales que se aprovechan en las vías para salvar accidentes topográficos, o cualquier obstáculo físico como: un río, un caño, un humedal, un cruce vial o una vía férrea.

La función principal de un puente es conectar dos (2) puntos para mejorar o permitir la movilidad vial entre estos. Otras funciones de los puentes son: mejorar la circulación vial en sitios muy concurridos, permitir el paso peatonal, permitir el paso de animales o paso de tuberías, entre otras.

Además del mantenimiento preventivo que se les debe realizar a los puentes, en ocasiones es necesario realizar una evaluación de la capacidad de carga, ya sea por el

deterioro normal por el paso de los años, por vulnerabilidad sísmica, por actualización de códigos, o por el aumento del tráfico y/o cargas que lo atraviesan.

Viendo la importancia de las vías y de sus componentes como los puentes para una sociedad, es de vital importancia que sus dirigentes se preocupen por el estado de conservación y de capacidad de carga de estos, tal es el caso de un cierto tipo de puentes en el estado de Indiana (Estados Unidos) que está desarrollando la universidad de Purdue ubicada en el mismo estado.

Como parte del proceso de acercamiento entre la Universidad de Purdue y la Escuela Colombiana de Ingeniería, se planteó este trabajo dirigido cuyo objetivo es evaluar la capacidad de carga de la superestructura de dos puentes vehiculares utilizando la metodología empleada para este fin en Colombia.

Capítulo I

Marco Teórico

En la siguiente sección se presentan la teoría que sirvió de base para el análisis estructural de los puentes, más la descripción general de los métodos que se emplearon para calcular las solicitaciones máximas, valores que fueron cotejados con los obtenidos con la ayuda del programa SAP2000, con el objeto de evitar desviaciones importantes en los datos base del estudio que aquí se propone.

En Colombia no existe una normativa clara para evaluar la capacidad de carga de los puentes, sin embargo mediante resolución número 000108 de 2015 se reglamentó la NORMA COLOMBIANA DE DISEÑO SÍSMICO DE PUENTES CCP-14, norma que como su nombre lo indica es para el diseño de estructuras nuevas y en ninguno de sus capítulos se presentan recomendaciones para la evaluación de estructuras existentes, por lo tanto el trabajo que aquí se desarrolló consistió en obtener las solicitaciones y deflexiones máximas de acuerdo con la geometría actual de las estructuras y normativa vigente, para luego calcular las solicitaciones resistentes de acuerdo con la información consignada en los planos como son; dimensiones, materiales y refuerzo.

Finalmente con los valores de las solicitaciones obtenidas, se calcularon los índices de sobre esfuerzo de las estructuras más sus deformaciones o deflexiones máximas.

Como los puentes a analizar se localizan en el estado de Indiana (Estados Unidos), se seguirán las recomendaciones dadas en la NORMA AASHTO 2012, norma en la que se basa el código colombiano CCP-14.

En este capítulo se incluye también una breve descripción de las recomendaciones dadas en la norma AASHTO LRFD 2012 para el diseño de puentes, recomendaciones que servirán cumplir con los objetivos de este trabajo.

1.1. Puente tipo losa

Un puente tipo losa es una estructura conformado por una placa maciza con espesor considerable, generalmente en concreto reforzado y simplemente apoyada, este tipo de puente se emplean para salvar luces pequeñas entre 6 a 18,0 m. (Véase Figura 1).

Figura 1 Puente tipo losa en concreto reforzado

Fuente: (Oldcastle Precast)

1.2. Puente tipo viga - losa

Un puente tipo viga losa es una estructura conformada por una losa superior apoyada sobre vigas descolgadas generalmente en concreto reforzado, algunas veces trabajando en sección compuesta. Las vigas pueden tener diferentes configuraciones como son; vigas en I, vigas rectangulares y vigas tipo cajón, estos elementos pueden ser de sección constante o variable. Este tipo de puentes generalmente se emplean para luces comprendidas entre 25,0 m y 35,0 m para luces continuas o simples. (Véase. Figura 2).

Figura 2 Puente tipo viga - losa en concreto reforzado

Fuente: (PACADAR, 2016)

1.3. Componentes de un puente

Los puentes generalmente están conformados por los siguientes elementos (Véase Figura 3):

1. Superficie y Equipamientos:

- Superficie de rodadura.
- Juntas. de expansión
- Andenes y/o bordillos
- Barandas
- Iluminación
- Señalización
- Drenajes.

2. Sub estructura:

- Aletas.
- Estribos
- Pilas

3. Superestructura:

- Losa.
- Vigas
- Riostras
- Arcos
- Apoyos

Figura 3 Componentes de un puente

Fuente: (INVIAS, 2006)

1.4. Teorema de Barret

El teorema predice que cuando hay más de una carga sobre un elemento simplemente apoyado, el momento máximo se produce en una posición de las cargas de tal manera que; el centro luz es equidistante de la resultante de la carga más pesada y más cercana a esta resultante. El momento máximo se producirá debajo de la carga más alta y más cercana al centro luz (Serquen, 2016). (Véase Figura 4).

Figura 4 Esquema teorema de Barret.

Fuente: (Serquen, 2016)

1.5. Líneas de influencia

La línea de influencia es la representación gráfica del efecto que una carga móvil tiene sobre una acción interna, (momento o cortante), una reacción o una deformación en una sección específica de una estructura.

Para determinar la línea de influencia de una reacción, fuerza interna o deformación, basta con desplazar una carga unitaria puntual $P=1$ sobre la estructura y analizar su efecto sobre la fuerza interna, reacción o deformación en una sección de interés. La línea que une las ordenadas N , bajo las diferentes posiciones de la carga, representa la línea de influencia de la reacción o de la fuerza interna (momento o cortante) correspondiente.

Los diagramas de fuerza normal N , fuerza cortante V , el momento flector M y torsor T son la representación gráfica del efecto causado por un tren de cargas inmóvil, es decir cuya posición es fija, a lo largo de diferentes secciones de una estructura. Por el contrario, la línea de influencia representa el efecto que una carga móvil produce sobre una reacción, sobre una fuerza interna, sobre un momento flector o momento torsor, sobre una deformación en una sección determinada de una estructura.

Diagrama de fuerzas internas: La carga es móvil. El diagrama indica el efecto de la carga móvil en todas las secciones de la estructura.

Línea de influencia: La carga es móvil y la sección considerada es fija. Por facilidad de cálculo se acostumbra suponer que la carga móvil igual a la unidad. La línea de influencia representa el efecto de una carga móvil sobre una reacción, una fuerza interna (N, V, M, T) o una deformación en una sección determinada de la estructura.

La gráfica siguiente muestra la diferencia entre los diagramas de fuerza cortante y momento flector, referidos a una viga simplemente apoyada, y la línea de influencia de la reacción en A, R_A , la reacción en B, R_B y el momento flector en C. (Bahena, Curso de puentes en concreto, Código Colombiano de Diseño Sismico de Puentes - 1995, 2004)

1.6. Especificaciones y requerimientos de la norma AASTHO 2012

En buena parte del continente americano, el diseño de puentes se ha practicado teniendo como referencia de primera mano las especificaciones americanas AASHTO [AMERICAN ASSOCIATION OF STATE HIGHWAY OFFICIALS], cuya primera norma, "STANDARD SPECIFICATIONS FOR HIGHWAY BRIDGES AND INCIDENTAL STRUCTURES", ampliamente reconocida, fue publicada en 1931 Posteriormente se denominó AASHTO [AMERICAN ASSOCIATION OF STATE

HIGHWAYS AND TRANSPORTATION OFFICIALS] y se creó el “AASHTO HIGHWAY SUBCOMMITTEE ON BRIDGES AND STRUCTURES”, autor y guardián de esta primera especificación. El título original de la especificación fue simplificado y en sus últimas ediciones consecutivas, con intervalos aproximados de cuatro años, lo hemos conocido como “STANDARD SPECIFICATIONS FOR HIGHWAY BRIDGES”. Su edición final, la “17th edition”, fue publicada en el año 2002.

En la introducción de la especificación AASHTO LRFD, 6a edición, se expresa: “El volumen de conocimientos relacionados con el diseño de puentes de carretera ha crecido enormemente desde 1931 y continua haciéndolo. La teoría y la práctica ha evolucionado significativamente, reflejando los avances de la investigación en el conocimiento de las propiedades de los materiales, sus mejoras, en el más racional y preciso análisis del comportamiento de las estructuras, en el advenimiento de los computadores y el rápido avance de su tecnología, en el estudio de los eventos externos que representan amenaza para los puentes, tales como eventos sísmicos, crecientes de los ríos y muchas otras áreas.”

En 1986, el subcomité de AASHTO encargado de estos asuntos manifestó el interés por efectuar una evaluación de las especificaciones AASHTO vigentes, revisar las especificaciones y códigos extranjeros y, lo más importante, considerar las alternativas de filosofía de diseño a las especificaciones estándar [Standard Specifications] que se estaban utilizando corrientemente. El trabajo fue realizado identificando y enmendando vacíos, inconsistencias y algunos conflictos. Y aún más, encontrando que la especificación no reflejaba los más recientes desarrollos de la filosofía de diseño con factores de diseño de carga y resistencia LRFD, enfoque que venía ganando terreno en otras áreas de la ingeniería estructural y en otras partes del mundo como Canadá y Europa. Finalmente, en 1994 AASHTO publica su primera edición de especificaciones para diseño de puentes basada en la filosofía LRFD, “AASHTO LRFD Bridge Design Specifications” Su más reciente publicación es la 7 más edición de 2014 (AASHTO, 2012)

1.6.1 Filosofía De Diseño

La filosofía de la norma AASHTO 2012, está basada en el concepto de estados límites, el cual se basa en la disminución de la probabilidad de falla de la estructura para ciertos estados límites, considerados importantes a valores aceptables.

La metodología de diseño por estados límite tiene dos características básicas: (1) trata de considerar todos los estados límites posibles y (2) está basado en métodos probabilistas.

Los estados límite deben estar suficientemente bien definidos, de tal manera que un diseñador sepa qué es considerado como aceptable o inaceptable. De mayor importancia es prevenir que los estados límites sean alcanzados, pero hay otras metas igualmente deseables: funcionalidad, apariencia y economía. No es económico diseñar un puente para que ninguno de sus componentes falle. Por lo tanto, es necesario determinar cuál es el nivel de riesgo o probabilidad de falla aceptable.

El criterio de diseño para estados límites se puede expresar matemáticamente de varias formas. Una de ellas, que utiliza coeficientes de carga y de resistencia, se puede expresar mediante la siguiente fórmula general, empleada en las Normas:

$$\phi R_n \geq \sum \gamma_k * Q_k$$

En donde el lado izquierdo de la ecuación se refiere a la resistencia de la estructura y el lado derecho al efecto de las cargas que actúan sobre ella. Los términos tienen el siguiente significado:

ϕ = Coeficiente de reducción de capacidad, también llamado coeficiente de resistencia, siempre menor o igual a uno.

R_n = resistencia nominal, calculada con una fórmula de un código estructural, utilizando las dimensiones nominales del elemento y las propiedades nominales del material. Es una fuerza interna generalizada: fuerza axial, momento flector o corte, asociada con el estado límite de capacidad o de funcionalidad en estudio.

Y_k = Coeficiente de carga que refleja la posibilidad de que se presenten sobrecargas y las incertidumbres inherentes al cálculo de los efectos de la carga. El subíndice k representa las varias cargas así: D para la carga muerta, L para la viva, E para el sismo, W para el viento, etc.

Q_k = Efecto de la carga de diseño

1.6.2 Sistema de unidades.

En el estudio de los puentes se empleará como sistema principal de unidades el sistema internacional de unidades (S.I.), con su equivalencia en el sistema inglés (U.S), tal como se presenta a continuación:

- **Sistema Internacional de unidades (S.I)**

- Longitud :Metros (m)
Milímetros (mm)
- Área :Metros cuadrados (m²)
Milímetros cuadrados (mm²)
- Fuerza :Newton (N)
Kilonewtons (kN)
- Masa :Kilogramo (kg)

- **Sistema Internacional de unidades inglés (U.S)**

- Longitud :Pie (ft)
Pulgada (in)
- Área :Pies cuadrados (ft²)
Pulgadas cuadradas (in²)
- Fuerza :libra (lb)
- Masa :libra-masa (lbm)

1.6.3 Clasificación de los puentes

De acuerdo al capítulo 4 de la norma AASTHO 2012 los puentes se deben clasificar en una de las tipologías que se indica en la tabla 4.6.2.2.1-1, la cual se presentan a continuación.

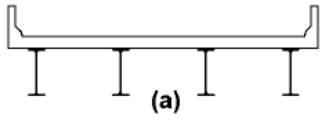

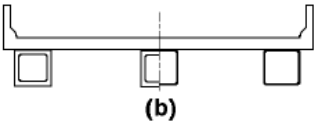

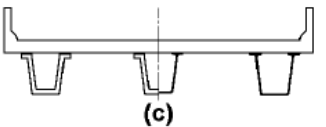

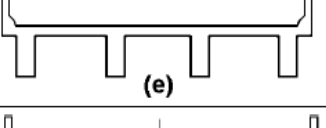

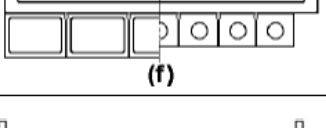

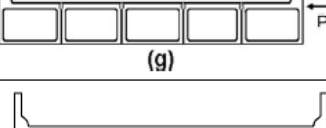

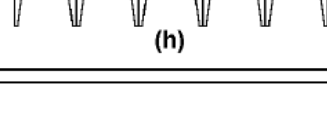

Supporting Components	Type Of Deck	Typical Cross-Section
Steel Beam	Cast-in-place concrete slab, precast concrete slab, steel grid, glued/spiked panels, stressed wood	
Closed Steel or Precast Concrete Boxes	Cast-in-place concrete slab	
Open Steel or Precast Concrete Boxes	Cast-in-place concrete slab, precast concrete deck slab	
Cast-in-Place Concrete Multicell Box	Monolithic concrete	
Cast-in-Place Concrete Tee Beam	Monolithic concrete	
Precast Solid, Voided or Cellular Concrete Boxes with Shear Keys	Cast-in-place concrete overlay	
Precast Solid, Voided, or Cellular Concrete Box with Shear Keys and with or without Transverse Post-Tensioning	Integral concrete	
Precast Concrete Channel Sections with Shear Keys	Cast-in-place concrete overlay	

Figura 6 Superestructuras comunes cubiertas en los artículos 4.6.2.2.2 y 4.6.2.2.3

Fuente: (AASHTO, 2012)

1.6.4 Chequeo de dimensiones

Dentro del análisis propuesto, se realizará una verificación de dimensiones de las superestructuras de los puentes, partiendo de la información consignada en los planos de diseño, contra las recomendadas en la tabla 2.5.2.6.3 -1 de la norma.

Table 2.5.2.6.3-1—Traditional Minimum Depths for Constant Depth Superstructures

Superstructure		Minimum Depth (Including Deck)	
		Simple Spans	Continuous Spans
Material	Type		
Reinforced Concrete	Slabs with main reinforcement parallel to traffic	$\frac{1.2 S + 10}{30}$	$\frac{S + 10}{30} \geq 0.54 \text{ ft.}$
	T-Beams	$0.070L$	$0.065L$
	Box Beams	$0.060L$	$0.055L$
	Pedestrian Structure Beams	$0.035L$	$0.033L$
Prestressed Concrete	Slabs	$0.030L \geq 6.5 \text{ in.}$	$0.027L \geq 6.5 \text{ in.}$
	CIP Box Beams	$0.045L$	$0.040L$
	Precast I-Beams	$0.045L$	$0.040L$
	Pedestrian Structure Beams	$0.033L$	$0.030L$
	Adjacent Box Beams	$0.030L$	$0.025L$
Steel	Overall Depth of Composite I-Beam	$0.040L$	$0.032L$
	Depth of I-Beam Portion of Composite I-Beam	$0.033L$	$0.027L$
	Trusses	$0.100L$	$0.100L$

When variable depth members are used, values may be adjusted to account for changes in relative stiffness of positive and negative moment sections

Figura 7 Profundidades mínimas para superestructuras de profundidad constante

Fuente: (AASHTO, 2012)

1.6.5 Cargas y factores de carga

La norma clasifica las cargas de la siguiente forma:

- Cargas permanentes = Peso propio y cargas muertas
- Cargas variables = Carga viva (Camiones de diseño)

1.6.5.1. Peso Propio y Cargas Muertas

Corresponde al peso propio de la estructura y el peso de los elementos que permanecerán fijos durante la vida útil de la estructura (cargas permanentes o comunes) para cada puente se realiza una evaluación particular de acuerdo con su geometría, componentes y el peso unitario de los materiales que se presentan en la tabla 3.5.1.-1 de la norma.

Material	Unit Weight (kcf)	
Aluminum Alloys	0.175	
Bituminous Wearing Surfaces	0.140	
Cast Iron	0.450	
Cinder Filling	0.060	
Compacted Sand, Silt, or Clay	0.120	
Concrete	Lightweight	0.110
	Sand-Lightweight	0.120
	Normal Weight with $f'_c \leq 5.0$ ksi	0.145
	Normal Weight with $5.0 < f'_c \leq 15.0$ ksi	$0.140 + 0.001 f'_c$
Loose Sand, Silt, or Gravel	0.100	
Soft Clay	0.100	
Rolled Gravel, Macadam, or Ballast	0.140	
Steel	0.490	
Stone Masonry	0.170	
Wood	Hard	0.060
	Soft	0.050
Water	Fresh	0.0624
	Salt	0.0640
Item	Weight per Unit Length (klf)	
Transit Rails, Ties, and Fastening per Track	0.200	

Figura 8 Peso unitarios de materiales para diseño de puentes

Fuente: (AASHTO, 2012)

1.6.5.2. Cargas vivas de vehículos

La carga viva vehicular mínima a considerar para determinar los índices de sobre esfuerzo de la superestructura de los puentes, es la establecida en el capítulo 3 de la norma, tal como se presenta en las siguientes figuras.

Figura 9 Cargas camión de diseño HL-93

Fuente: (AASHTO, 2012)

Figura 10 Cargas de diseño – Tándem

Fuente: Elaboración propia

Figura 11 Carga de diseño – Línea de carga

Fuente: Elaboración propia

De acuerdo al capítulo 3.6.1.3 de Norma, el efecto extremo por el paso de vehículos sobre un puente, se debe tomar como la mayor de los siguientes:

1. Camión de diseño más línea de carga.

Figura 12 Combinación camión HL-93 más línea de carga

Fuente: Elaboración propia

2. Tándem de diseño más línea de carga.

Figura 13 Combinación Tándem de diseño más línea de carga

Fuente: Elaboración propia

Adicionalmente los efectos estáticos del camión o tándem de diseño, deben incrementarse por el porcentaje especificado en la siguiente tabla. Para tener en cuenta en el diseño efectos dinámicos.

Tabla 1 Amplificación de Carga viva (IM)

Component	IM
Deck Joints—All Limit States	75%
All Other Components:	
• Fatigue and Fracture Limit State	15%
• All Other Limit States	33%

Fuente: (AASHTO, 2012)

1.6.6 Factores de distribución

La norma divide el diseño de los elementos internos de los elementos externos, esta división se realiza con los factores de distribución, empleados para las solicitaciones por flexión y cortante, de acuerdo con lo indicado en el numeral 4.6.2.2.2. El factor de distribución es el porcentaje de momento flector o cortante que recibe cada uno de los elementos de un puente, debido a la acción de la carga viva. Las ecuaciones para el cálculo del factor de distribución para momento o cortante depende de si el elemento en estudio es interior o exterior y del número de carriles cargados. En las siguientes tablas se presentan las ecuaciones para calcular estos valores.

Tabla 2 Distribución de cargas vivas para momentos en vigas interiores - 1

Table 4.6.2.2.2b-1—Distribution of Live Loads for Moment in Interior Beams

Fuente: (AASHTO, 2012)

Para determinar los índices de sobre esfuerzo y deformaciones de los dos puentes, se emplearan las siguientes combinaciones:

- Combinación Servicio 1-1 = 1.0 D.C+1.0 DW+1.0 HL-93*IM+1.0 LÍNEA DE CARGA.
- Combinación Servicio 1-2 = 1.0 D.C+1.0 DW+1.0 TÁNDEM*IM+1.0 LÍNEA DE CARGA.

- Combinación Resistencia 1-1 = 1.25 D.C+1.50 DW+1.75 HL-93*IM+1.75 LÍNEA DE CARGA.
- Combinación Resistencia 1-2 = 1.25 D.C+1.50 DW+1.75 TÁNDEM*IM+1.75 LÍNEA DE CARGA

Dónde: IM = 1.33

El chequeo de deflexiones se realizara con las con las siguientes combinaciones

- Combinación DFL1 = HL-93*25%+1.0 LÍNEA DE CARGA
- Combinación DFL2 = TÁNDEM*25%+1.0 LÍNEA DE CARGA
- Combinación DFL3 = HL-93

1.6.8 Momento resistente

En el capítulo 5.7.3.2 de la norma se indica que la resistencia a flexión de un elemento deber ser igual a:

$$M_r = \Phi M_n \text{ Ecuación (5.7.3.2.1-1)}$$

Dónde:

Φ = Factor de resistencia especificado en el artículo 5.5.4.2

5.5.4.2—Resistance Factors	
5.5.4.2.1—Conventional Construction	
Resistance factor ϕ shall be taken as:	
• For tension-controlled reinforced concrete sections as defined in Article 5.7.2.1	0.90
• For tension-controlled prestressed concrete sections as defined in Article 5.7.2.1	1.00
• For shear and torsion:	
normal weight concrete.....	0.90
lightweight concrete.....	0.80
• For compression-controlled sections with spirals or ties, as defined in Article 5.7.2.1, except as specified in Articles 5.10.11.3 and 5.10.11.4.1b for Seismic Zones 2, 3, and 4 at the extreme event limit state	0.75
• For bearing on concrete.....	0.70
• For compression in strut-and-tie models.....	0.70

Figura 14 Factores de resistencia recomendados en la norma

Fuente: (AASHTO, 2012)

M_n = (Resistencia nominal)

$$M_n = A_p f_p \left(d_r - \frac{a}{2} \right) + A_s f_s \left(d_s - \frac{a}{2} \right) - A'_s f'_s \left(d'_s - \frac{a}{2} \right) + 0.85 f'_c (b - b_w) h_f \left(\frac{a}{2} - \frac{h_f}{2} \right) \quad (5.7.3.2.2-1)$$

Figura 15 Ecuación para calcular la resistencia a flexión de elementos estructurales

Fuente: (AASHTO, 2012)

1.6.9 Cortante resistente

En el capítulo 5.8.1.1 de la norma AASHTO 2012 se indica que, cuando sea razonable suponer que las secciones planas permanecen planas después de la

carga, las regiones de los elementos deben diseñarse para cortante y torsión usando, ya sea el modelo seccional especificado en el Artículo 5.8.3, o el modelo de puntal-tensor especificado en el Artículo 5.6.3, por lo tanto; la resistencia a cortante de un elemento empelando el modelo del artículo 5.8.3 debe calcularse como:

$$V_r = \Phi V_n \quad \text{Ecuación (5.8.2.1-2)}$$

Dónde:

Φ = Factor de resistencia especificado en el artículo 5.5.4.2

V_n = Resistencia nominal a cortante

5.8.3.3—Nominal Shear Resistance	
The nominal shear resistance, V_n , shall be determined as the lesser of:	
$V_n = V_c + V_s + V_p$	(5.8.3.3-1)
$V_n = 0.25 f_c' b_v d_v + V_p$	(5.8.3.3-2)
in which:	
$V_c = 0.0316 \beta \sqrt{f_c'} b_v d_v$, if the procedures of Articles 5.8.3.4.1 or 5.8.3.4.2 are used	(5.8.3.3-3)
V_c = the lesser of V_{ci} and V_{cv} , if the procedures of Article 5.8.3.4.3 are used	
$V_s = \frac{A_v f_y d_v (\cot \theta + \cot \alpha) \sin \alpha}{s}$	(5.8.3.3-4)
Where transverse reinforcement consists of a single longitudinal bar or a single group of parallel longitudinal bars bent up at the same distance from the support, the shear resistance V_s provided by these bars shall be determined as:	
$V_s = A_v f_y \sin \alpha \leq 0.095 \sqrt{f_c'} b_v d_v$	(5.8.3.3-5)

Figura 16 Resistencia nominal a corte de una sección

Fuente: (AASHTO, 2012)

1.6.10 Parámetros para deflexiones

Para el cálculo de deflexiones instantáneas se indica en el capítulo 5.7.3.6.2 que se debe realizar empleando el módulo de elasticidad del concreto especificado en el capítulo 5.4.2.4 tomando el momento de inercia bruto I_g o un momento de inercia efectivo I_e

5.4.2.4—Modulus of Elasticity

In the absence of measured data, the modulus of elasticity, E_c , for concretes with unit weights between 0.090 and 0.155 kcf and specified compressive strengths up to 15.0 ksi may be taken as:

$$E_c = 33,000 K_1 w_c^{1.5} \sqrt{f'_c} \quad (5.4.2.4-1)$$

Figura 17 Ecuación para calcular módulo de elasticidad del concreto

Fuente: (AASHTO, 2012)

$$I_e = \left(\frac{M_{cr}}{M_a}\right)^3 I_g + \left[1 - \left(\frac{M_{cr}}{M_a}\right)^3\right] I_{cr} \leq I_g \quad (5.7.3.6.2-1)$$

in which:

$$M_{cr} = f_r \frac{I_g}{y_t} \quad (5.7.3.6.2-2)$$

where:

M_{cr} = cracking moment (kip-in.)
 f_r = modulus of rupture of concrete as specified in Article 5.4.2.6 (ksi)

Figura 18 Ecuación para calcular momento efectivo de inercia

Fuente: (AASHTO, 2012)

Los límites para el chequeo de deflexiones, en puentes vehiculares se presentan en el capítulo 2.5.2.6.2 de la norma los cuales se presentan a continuación.

<p>In the absence of other criteria, the following deflection limits may be considered for steel, aluminum, and/or concrete vehicular bridges:</p>	
• Vehicular load, general	Span/800,
• Vehicular and pedestrian loads	Span/1000,
• Vehicular load on cantilever arms.....	Span/300, and
• Vehicular and pedestrian loads on cantilever arms	Span/375.

Figura 19 Límites para deflexiones verticales

Fuente: (AASHTO, 2012)

1.6.11 Método puntal tensor

El método de puntal tensor tiene su origen en los modelos de armaduras propuestos a principios del siglo XX, para explicar el comportamiento a cortante en vigas de concreto reforzado. El método está basado en la teoría de plasticidad y sirve para calcular la resistencia de un elemento estructural una vez éste ha alcanzado el estado límite de agrietamiento. El método se emplea en elementos estructurales en los cuales, debido a la magnitud de las fuerzas o a la geometría del elemento, no son válidas las hipótesis en las que se basa el diseño a flexión de vigas, es decir, la distribución de esfuerzos no es uniforme; a estos elementos o zonas de disturbio se le llama "Regiones de discontinuidad o regiones D", en la actualidad, el método ha sido calibrado y plasmado en códigos de diseño como la AASTHO 2012 (SCRIBD)

Figura 20 Representación Zonas "D" en modelo puntal tensor

Fuente: (SCRIBD)

De acuerdo a la norma AASTHO 2012 los modelos de puntal- tensor pueden usarse para determinar las fuerzas internas cerca de los apoyos y en los puntos de aplicación de cargas concentradas, en los estados límite de resistencia y evento extremo. El modelo de puntal-tensor debería considerarse para el diseño de cimentaciones profundas y dados de pilotes o en todas las situaciones en las cuales la distancia entre los centros de aplicación de carga y las reacciones es menor que aproximadamente dos veces el espesor del miembro.

- **Modelación;** La estructura, un elemento o una región de la misma, puede modelarse como un sistema de tensores de acero a tracción y puntales de concreto a compresión interconectados en nudos para formar una cercha capaz de llevar todas las cargas aplicadas a los apoyos. Deben considerarse los espesores requeridos de los puntales a compresión y de los tensores a tracción para determinar la geometría de la cercha.

La resistencia, P_r , de los puntales y los tensores debe tomarse como la de los elementos cargados axialmente:

$$P_r = \Phi P_n \quad (5.6.3.2-1)$$

Dónde:

P_n = Resistencia del puntal o tensor (kips).

Φ = Factor de resistencia para tracción o compresión

- **Resistencia del puntal sin refuerzo**

La resistencia nominal de un puntal de compresión sin refuerzo debe tomarse como:

$$P_n = f_{cu} * A_{cs} \text{ (5.6.3.3.1-1)}$$

Dónde:

P_n = Resistencia nominal del puntal de compresión (kip).

f_{cu} = Limite del esfuerzo de compresión especificado en el artículo 5.6.3.3.3 (ksi)

A_{cs} = Área transversal efectiva del puntal especificada en el Artículo 5.6.3.3.2 (in²)

- **Área transversal efectiva del puntal**

El valor de A_{cs} debe determinarse considerando el área disponible de concreto y las condiciones de anclaje en los extremos del puntal, como se muestra en la Figura 21 y Figura 22. Cuando el puntal está anclado con refuerzo, puede considerarse que el área efectiva de concreto se extiende una distancia de hasta seis diámetros de la barra de anclaje, como se muestra en la Figura 22.

Figura 21 Detalle biela anclada con armadura

Fuente: (AIS, 2014)

Figura 22 Detalle biela anclada con apoyo y otra biela

Fuente: (AIS, 2014)

- **Esfuerzo límite de compresión en el puntal**

El esfuerzo límite de compresión, f_{cu} , debe ser;

$$f_{cu} = \frac{f'_c}{0.8 + 170\varepsilon_l} \leq 0.85 f'_c \quad (5.6.3.3.3-1)$$

in which:

$$\varepsilon_l = \varepsilon_s + (\varepsilon_s + 0.002) \cot^2 \alpha_s \quad (5.6.3.3.3-2)$$

Dónde:

α_s = El menor Angulo entre el puntal de compresión y los tensores adyacentes de tracción (Grados).

ϵ_s = Deformación unitaria de tracción en el concreto en la dirección del tensor de tracción (in/in).

f'_c = Resistencia especificada a la compresión (ksi)

- **Resistencia del tensor**

El refuerzo del tensor de tracción debe anclarse en las zonas nodales por medio de longitudes de refuerzo embebido en el concreto, de ganchos, o de anclajes mecánicos especificados. Las fuerzas de tracción deben desarrollarse en la cara interior de la zona nodal.

La resistencia nominal del tensor de tracción en kips debe ser:

$$P_n = f_y A_{st} + A_{ps} [f_{pe} + f_y] \quad (5.6.3.4.1-1)$$

Dónde:

A_{st} = Área total de refuerzo no tensionado longitudinal en el tensor (in²)

A_{ps} = Área del acero de preesfuerzo (in²)

f_y = Resistencia de fluencia del acero dulce de refuerzo longitudinal (ksi)

F_{pe} = Esfuerzo en el acero de preesfuerzo debida al preesforzado después de descontadas las pérdidas (ksi)

- **Dimensionamiento de las regiones del nudo**

A menos que se proporcione refuerzo de confinamiento y que su efecto esté soportado mediante análisis o experimentación, los esfuerzos de compresión en las regiones del nudo del puntal no deben exceder:

- Para regiones de nudo limitadas por puntales de compresión y área de apoyo: $0.85f$

- Para regiones de nodo que anclan un tensor de tracción unidireccional: $0.75f$
- Para regiones de nodo que anclan tensores de tracción en más de una dirección: $0.65f$

Dónde:

Φ = factor de resistencia para apoyo en concreto, como se especifica en el Artículo 5.5.4.2.

El refuerzo del tensor debe estar uniformemente distribuido sobre un área efectiva de concreto, por lo menos, igual a La fuerza en el tensor de tracción dividida por los límites de esfuerzo especificados.

Además de satisfacer los criterios de resistencia para puntales de compresión y tensores de tracción, las regiones de nodo deben diseñarse para cumplir con los límites de esfuerzo y anclaje especificados en los Artículos 5.63.4.1 y 6.3.4.2.

El esfuerzo de aplastamiento en la región del nodo, producido por las cargas concentradas o por las reacciones, debe satisfacer los requisitos especificados en el Artículo 5.7.5.

1.7. Definición índice de sobre esfuerzo.

Un índice de sobre esfuerzo se define como la división entre la sollicitación actuante sobre la sollicitación resistente, de acuerdo a lo anterior a continuación se presenta la fórmula empleada para calcular los índices de sobre esfuerzo para momento y cortante de los puentes en estudio:

- Índice de sobre esfuerzo para momento $ISM = M_u / \Phi M_n$
- Índice de sobre esfuerzo para momento $ISV = V_u / \Phi V_n$

Capitulo II

Metodología

Actualmente Colombia cuenta con el manual de inspección de puentes (SIPUCOL) y el manual para la inspección visual de puentes y pontones del INVIAS, manuales donde se brindan recomendaciones para determinar el estado de conservación y mantenimiento de los puentes, realizando una inspección visual y registro de daños únicamente. Sin embargo para determinar la capacidad de carga de estos, desde el punto de vista estructural, no se cuenta con una metodología o reglamento bien definido, caso contrario ocurre en Estados Unidos, donde se localizan los puentes en estudio, que cuenta con el manual para evaluación de puentes (MBE) "The Manual for Bridge Evaluation (MBE)". Dado que el proyecto propuesto es determinar la capacidad de carga de dos puentes vehiculares localizados en el estado de Indiana Estados Unidos, empleando la metodología Colombiana, pero como se indicó anteriormente en el país no contamos con normas para este fin, por tal razón la metodología que se propone es; Seguir las recomendaciones dadas en la norma estadounidense AASHTO LRDF 2012 para el diseño estructural de puentes nuevos. Lo anterior con el propósito de obtener las solicitaciones actuantes en la superestructura de los puentes y sus deformaciones, para luego calcular los momentos y cortantes resistentes de acuerdo a la información registrada en los planos de diseño. Finalmente con los resultados obtenidos; de solicitaciones actuantes vs resistentes se obtienen los índices de sobre esfuerzo y se comparan las deformaciones con límites recomendados en la norma.

2.1. Objetivo general

Determinar los índices de sobre esfuerzo y cálculo de deformaciones bajo la carga del camión de diseño HL-93 y la Norma AASHTO LRFD 2012, para la superestructura de dos puentes vehiculares.

2.2. Etapas del estudio

El trabajo se desarrolló en cuatro etapas, las cuales se presentan a continuación, aclarando que cuando se mencione “norma” en el desarrollo del trabajo, se refiere a la **AASHTO LRFD 2012**, a menos que se realice cualquier otra aclaración.

2.2.1 Primera etapa

En esta etapa, se hizo un estudio detallado de la información suministrada por la universidad de Purdue, la cual consto de veinte cuatro (24) planos, que sirvieron de base para identificar: La localización y tipo de puentes, materiales, refuerzo suministrado, numero de calzadas, geometría, dimensiones, intervenciones realizadas, antigüedad de los puentes y norma con que fueron diseñados.

En esta etapa también se realizó una revisión bibliográfica, y estudio de la Norma AASHTO LRFD 2012 y CCP-14.

2.2.2 Segunda etapa

En esta etapa se procedió a transcribir la información extraída de los planos de diseño a AutoCAD, información que servicio de base para realizar la evaluación de cargas muertas de cada uno de los puentes, además de determinar cuantías de acero de refuerzo suministrado a los elementos en estudio. Paralelamente a este trabajo se definieron: Combinaciones de carga, anchos de franjas y se calcularon los factores de distribución para el análisis de los elementos tanto internos como externos.

2.2.3 Tercera etapa

En esta etapa se procedió a calcular las solicitaciones actuantes bajo las cargas sobrepuestas en las vigas del puente No 1 y en los anchos de franja del puente No 2, empleando el teorema de Barret para el puente No 1 y las líneas de influencia en el puente No 2. La tarea anterior se realizó nuevamente en los dos puentes pero con la ayuda del programa SAP2000.

Una vez obtenidos los resultados por las dos metodologías, se hizo una comparación de resultados con el ánimo de evitar desviaciones importantes en los

datos con que se determinaron los índices de sobre esfuerzo de los puentes. En esta etapa también se calcularán las deflexiones de acuerdo a lo indicado en la norma.

2.2.4 Cuarta etapa

Finalmente en esta etapa se determinaron los momentos y cortantes resistentes de las vigas del puente No 1 y las franjas del puente No 2, de acuerdo con los requerimientos establecidos en la norma e información consignada en los planos de diseño. Con los valores obtenidos finalmente se determinaron los índices de sobre esfuerzo de las vigas del puente No 1 y las franjas del puente No 2 además de comparar las deflexiones de los puentes contra los límites recomendados en la norma.

Capítulo III

Resultados

En este capítulo se presentara las limitaciones del proyecto, localización de los puentes, una breve descripción de los mismos, además de los resultados obtenidos. El estudio de los puentes se presenta tal como se indica a continuación.

1. Resultados del puente denominado como No 1
2. Resultados del puente denominado No 2.

3.1. Limitaciones

Para la revisión de los puentes se partirá de la información extraída de los planos, asumiendo para los cálculos la información plasmada en estos como son: La geometría de los puentes, dimensiones, materiales y refuerzo suministrado, esto por tratarse de un trabajo puramente académica, caso contrario cuando se requiera realizar estudios de vulnerabilidad a puentes existentes, para lo cual se debe confrontar la información consignada en los planos de diseño contra los resultados obtenidos en los trabajos de campo, dentro de los cuales se deben realizar como mínimo los siguientes:

1. Levantamiento topográfico detallado, tanto de la geometría del puente como de sus dimensiones.
2. Inspección visual detallada, para registro de daños.
3. Toma de muestras.
4. Ensayos de laboratorio:
 - a. Ensayos con esclerómetro.
 - b. Ensayos de carbonatación.
 - c. Ensayos de resistencia
 - d. Apiques

El trabajo que aquí se desarrolla, se analiza únicamente para cargas gravitacionales, dado que dentro de la información suministrada por universidad de Purdue, no se entregaron paramentos sísmicos para su análisis, o estudio

geotécnico en su lugar, además por la localización de los puentes, es zona de amenaza sísmica baja.

3.2. Localización puentes

Los puentes en estudio se localizan en la ruta 31 en el estado de Indiana Estados Unidos, tal como se presenta en la siguiente figura.

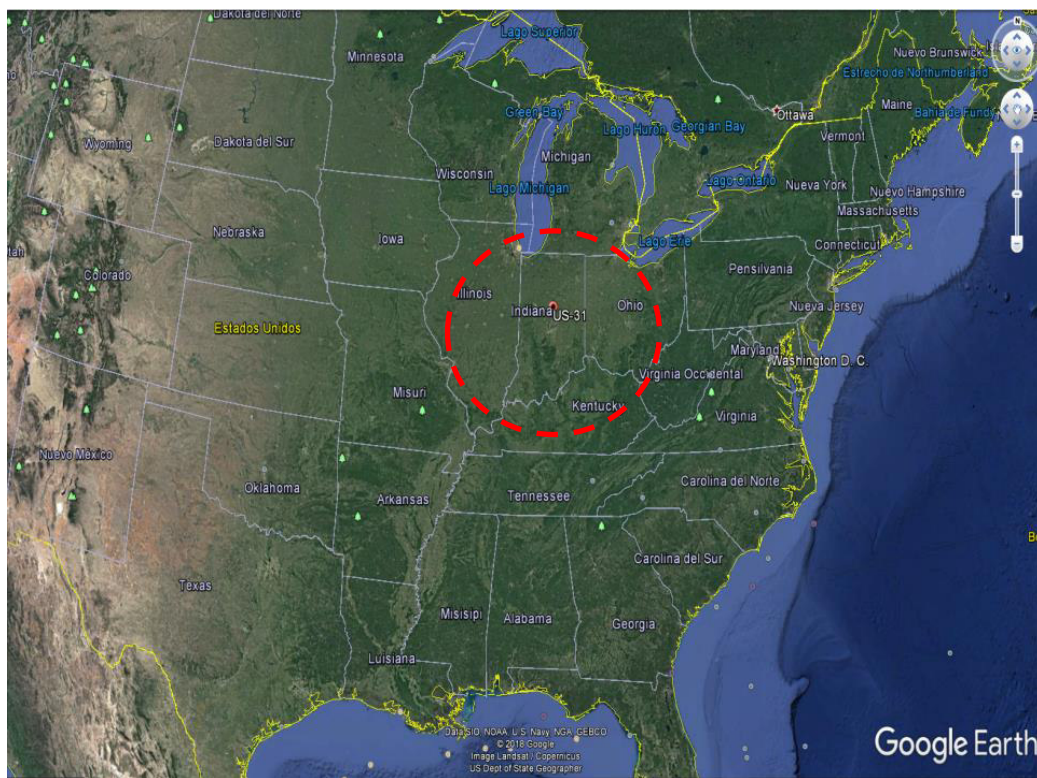

Figura 23 Localización general puentes

Fuente: Google Earth

3.3. Descripción general de los puentes

Para facilitar el estudio que aquí se propone, se denominó como puente No 1 el que da paso a los vehículos en sentido Norte – Sur, y puente No 2 al que da vía en sentido Sur – Norte.

3.3.1 Descripción puente No 1

Según información recibida, el puente No 1, fue aprobado y adoptado por la comisión estatal de carreteras del estado de Indiana el cinco (5) de marzo de 1951, y fue diseñado acorde con la especificación A.A.S.H.O. de 1949 con el camión de diseño H 20-S 16-44 como carga viva, y en concreto reforzado tipo “E” para la cimentación y tipo “F” para la superestructura. La geometría en planta presenta esviaje de 30 grados respecto al eje longitudinal del puente, tanto a la entrada como a la salida, la superestructura consta de seis vigas simplemente apoyadas de sección en T, separadas entre sí 8,0 ft (2,43 m), cada viga cuenta con una altura de 2,0 ft y 4 in (0,71 m) por 1,0 ft y 8,50 in (0,52 m) de base, las aletas de las vigas tienen un espesor de 7,25 in (0,18 m) por 8,0 ft (2,43 m), de ancho para las vigas interiores y 68, in (1,72 m) para las vigas exteriores. La superestructura se apoya en sus extremos sobre estribos tipo muro, los cuales cuentan con una cimentación superficial del tipo zapatas corridas. El ancho total tablero fuera a fuera es de 43 ft y 8 in (13,30 m), el cual está dividido en dos carriles centrales de 12,0 ft (3,65 m), dos sobre anchos o bermas de 8,0 ft y 6 ft (2,60 m) una en cada costado y dos barandas de 1,0 ft y 4,0 in (0,40 m) de ancho por 2,0 ft y 4 in (0,71 m) de alto. En septiembre 30 de 1992 fue aprobado por parte del departamento de Indiana una intervención para realizar la instalación de barandas laterales de protección, además de la instalación de un revestimiento de protección con geotextiles a los estribos.

En la Figura 24 a Figura 27 se presentan; La planta, sección transversal, el perfil longitudinal y las notas generales del diseño estructural del puente No 1, tomadas de los planos suministrados. En la Figura 28 Figura 31 se presenta nuevamente la

planta, sección transversal y perfil longitudinal del puente, transcrita en AutoCAD de los planos originales, y en la Fotografía 1 se presenta una imagen tomada con la ayuda del programa Google Earth del estado de conservación del puente en la actualidad.

3.3.2 Descripción puente No 2

El puente No 2, fue aprobado y adoptado por la comisión estatal de carreteras del estado de Indiana el trece (13) de enero de 1959, fue diseñado acorde con la especificación A.A.S.H.O. de 1957 con el camión de diseño H 20-S16-44 como carga viva y en concreto reforzado tipo “E” para la cimentación y estribos y concreto tipo “F” para la superestructura. La geometría en planta presenta esviaje de 30 grados respecto al eje longitudinal del puente, tanto a la entrada como a la salida, el puente tiene tres luces distribuidas de la siguiente manera; Dos luces de 28,0 ft y 1,50 in (8,56 m) de longitud, una en cada extremo y una luz central de 37,0 ft y 6 in (11,42 m), para una longitud total de 93 ft y 9,0 in (28, 57 m), la superestructura consta de una losa maciza de 1,0 ft y 6,0 in (0,457 m) de espesor, apoyada en sus extremos sobre una viga cabezal, la cual a su vez transmite las cargas al terreno de fundación por medio de una cimentación profunda compuesta por pilotes. Los apoyos intermedios de la superestructura están compuestos por estribos tipo muros, cimentados sobre zapatas corridas.

El ancho total tablero fuera a fuera es de 43 ft y 8 in (13, 20 m), el cual está dividido en dos carriles centrales de 12,0 ft (3, 65 m), dos sobre anchos o bermas de 8,0 ft y 6 ft (2, 60 m) una cada costado y dos barandas de 1,0 ft y 4,0 in (0,40 m) de ancho por 2,0 ft y 4 in (0,71 m) de alto.

En septiembre 30 de 1992 fue aprobado por parte del departamento de indiana una intervención para realizar la remoción y construcción de nuevas losas de aporroche al puente más barandas laterales de protección y la instalación de un revestimiento de protección con geotextiles a los estribos intermedios y vigas cabezal.

En la Figura 32, a Figura 35 se presenta; La planta, sección transversal, el perfil longitudinal y las notas generales de diseño estructural del puente No 2, tomadas de los planos suministrados. En la Figura 36 a Figura 39, se presenta nuevamente la planta, sección transversal y perfil longitudinal del puente, transcrita en AutoCAD de los planos originales, en la Fotografía 2 se presenta una imagen tomada con la ayuda del programa Google Earth del estado de conservación del puente en la actualidad.

<u>DESIGN DATA:-</u>		4	IND.	F-18(15)	1959	9	29
Designed for :20-516-44 Loading in accordance with 1957 AASHO Specifications.							
<u>TYPICAL CROSS-SECTION:-</u>							
For Typical Cross-Section see Sheet V ^a 3. For typical P.C.C. Pavement reinforcing see Sheet N ^o 2, Road Std. E-11-IR (adopted July 1953).							
<u>JOINT LEGEND:-</u>							
Joint "J" indicates 1/2" preformed joint filler under front 6" of slab bearing area and one layer of medium weight roofing felt under remainder of bearing area. Joint "Q" indicates 1/2" preformed joint filler placed longitudinally on each of the outer 3" portions of the pier bearing area with concrete to concrete bearing under the remaining portion. Joint "I" indicates 1/2" preformed joint filler placed longitudinally on each of the outer 3" portions of the pier bearing area and one layer of medium weight roofing felt under remainder of bearing area. 1" Exp. Jt. see Br. Std. "C".							
<u>GENERAL NOTES:-</u>							
No present structure at proposed C.B. Lane bridge site. Depth of footings to be extended if found necessary. See Art. B 403.2 (a) of the Specifications. Piles shall have minimum bearing value shown on detail drawings. Determine pile lengths by Art. F 203 of Specifications. For details of steel encased concrete piles see Br. Std. "C", the special provisions, and applicable articles in the Specifications. Piles shall be driven to elevation shown on plans or below, if necessary, to obtain desired bearing. Reinforcing steel covering shall be 1 1/2" in floor slabs, 3" in footings except bottom steel which shall be 4", and 2" in all other parts, unless noted. Concrete in footings and pier stems to bottom of coping to be class "E". Concrete in superstructure, including railing, bent caps, top of piers above bottom of coping to be class "F". Concrete in structure not noted above, in steel encased concrete piles, concrete slopewall, inlets & hdws. to be class "D". Continuous concrete pours shall be required between const. jts. as shown on detail plans. Beverl forms 1/4" under copings; chamfer exposed edges 1" unless noted. 2 roadway drainage outlets to be placed as shown on this drawing. Construct slopewall at locations as shown on Layout. Tolerance in position of pile head maximum 2". 3" expansion joint to be placed in approach pavement approximately 60' from each end of bridge floor. All railings to be constructed perpendicular to grade. Railing & Posts are aluminum. See Br. Std. "R".

3.4. Análisis puente No 1

Dado que el puente es simétrico respecto a su eje longitudinal se analizará una viga de exterior y una intermedia para cargas verticales, esto por no contar con

información de geotecnia y parámetros sísmicos donde se localiza el puente. Las vigas se analizaron siguiendo la secuencia que se presenta a continuación:

1. Evaluación de cargas
2. Calculo de factores de distribución para momento y cortante
3. Calculo de solicitaciones con el Teorema de Barret
4. Calculo de solicitaciones ayuda de SAP2000
5. Comparación de solicitaciones calculadas con teorema de Barret Vs SAP2000
6. Calculo de los índices de sobre esfuerzo por momento y cortante en vigas
7. Chequeo deformaciones.

3.4.1 Materiales Puente No 1

De acuerdo con la información suministrada la superestructura del puente fue diseñada con concreto clase "F" y acero de refuerzo PDR 60, a continuación se presentan las propiedades de estos materiales:

- Concreto estructural clase "F":
 - Resistencia mínima a la compresión, $f'c = 14,0 \text{ MPa}$
 $= 2030 \text{ PSI}$
 - Módulo de Elasticidad, $E_c = 17.585,8 \text{ MPa}$
 $= 2550487 \text{ PSI}$
- Acero de refuerzo:
 - Esfuerzo de fluencia, $f_y = 420 \text{ MPa}$
 $= 60 \text{ ksi}$
 - Módulo de Elasticidad, $E_s = 200.000 \text{ MPa}$
 $= 29000. \text{ ksi}$

3.4.2 Análisis viga externa (VGE)

3.4.2.1. Carga muerta “DC” y “DW”

Acorde con la sección 3.3.2 de la norma, el patrón de carga denominado DC corresponde al peso propio de los componentes estructurales y accesorios no estructurales, sin embargo la carpeta de rodadura que se indica en los planos pero que no se observa en las imágenes tomadas con ayuda del Google Earth, es considerada como un accesorio no estructural, debido a que hace parte integral e indispensable para el funcionamiento del puente, pero la cual puede ser removida sin afectar el funcionamiento del puente, pero puede ser altamente susceptibles de cambios en el tiempo, por tal razón se clasifica dentro del grupo de cargas DW.

En la siguiente tabla se presenta el avalúo de cargas muertas para la viga VGE.

	b1=	0.52m	= 1.7 ft	h3-2 =	0.20m	= 0.7 ft	
	b2=	0.26m	= 0.9 ft	h4 =	0.09m	= 0.3 ft

Tabla 9 Evaluación de cargas muertas para VGE– Puentes 1.

Fuente: Elaboración propia

3.4.2.2. Carga viva “L”

El puente se analizó con las cargas generadas por el camión de diseño HL-93, el tándem de diseño y la línea de carga, tal como se indica en el numeral 1.6.5.2 de este documento.

3.4.2.3. Factores de distribución para momento y cortante -

VGE

De acuerdo al capítulo 4 de la norma los momentos y cortantes generados por carga viva se deben afectar por unos factores de distribución “g”, esto para tener en cuenta la presencia múltiple de los vehículos sobre la viga, antes de calcular los factores de distribución, se presenta la clasificación del puente de acuerdo con la norma, labor que es necesaria para calcular los factores de distribución.

- De acuerdo con el capítulo 4 de la norma y Figura 6 de este documento el puente No 1 se clasifica como tipo (e), viga T de concreto fundido in situ con tablero monolítico.

A continuación se presenta el cálculo de los factores de distribución para momento y cortante para la viga externa.

Factor de distribución para momento VGE.

- L1= 0.52 m = 1.7 ft
- L2= 2.41 m = 7.9 ft
- L3= 0.30 m = 1.0 ft
- L4= 0.60 m = 2.0 ft
- L5= 1.80 m = 5.9 ft
- L6= 0.23 m = 0.8 ft
- b= 0.52 m = 1.7 ft Base de la viga
- de= 0.53 m = 1.7 ft
- L= 11.84 = 38.8 ft
- gmi= 0.70 Factor de distribución VGI
- tan 30 0.5773

Verificación rango de aplicación Tabla 4.6.2.2.2d-1

-1.0 ft ≤ de ≤ 6 ft **Cumple**

Factor de distribución un carril cargado (gme1) Tabla 4.6.2.2.2d-1

Regla de la palanca

gme1= 0.469

Como se utilizo la regla de la palanca para determinar el factor de distribución este debe ser afectado por el factor presencia múltiple de 1.2 tomado de la tabla 3.6.1.1.2-1

Number of Loaded Lanes	Multiple Presence Factors, m
1	1.20
2	1.00
3	0.85
>3	0.65

gme1= 0.563 No rige

Factor de distribución para dos carriles cargados (gme2)

$g = e g_{interior}$

$e = 0.77 + \frac{d_e}{9.1}$

e= 0.961

gme2= 0.673 Rige

Debido al que el puente es esviado el factor de distribución "g" para momento de la viga exterior debe reducido de acuerdo con el resultado de la siguiente ecuación:

$1 - c_1 (\tan \theta)^{1.5}$

$c_1 = 0.25 \left(\frac{K_g}{12.0 L I_s^3} \right)^{0.25} \left(\frac{S}{L} \right)^{0.5}$

If $\theta < 30^\circ$ then $c_1 = 0.0$

If $\theta > 60^\circ$ use $\theta = 60^\circ$

c1= 0.101

fr = 0.96

Factor de distribución para diseño

g-VG= 0.643

Factor de distribución para cortante VGE

- L1= 0.52 m = 1.7 ft
- L2= 2.41 m = 7.9 ft
- L3= 0.30 m = 1.0 ft
- L4= 0.60 m = 2.0 ft
- L5= 1.80 m = 5.9 ft
- L6= 0.23 m = 0.8 ft
- b= 0.52 m = 1.7 ft Base de la viga
- de= 0.53 m = 1.7 ft
- t= 0.18 m = 0.6 ft
- L= 11.84 = 38.8 ft
- Tan 30° : 0.5773
- gvi= 0.819 Facto distribución VGI

Verificación rango de aplicación Tabla 4.6.2.23b-1

$$-1.0 \text{ ft} \leq de \leq 5.5 \text{ ft} \quad \text{Cumple}$$

Factor de distribución un carril cargado (gve1) Tabla 4.6.2.23b-1

Regla de la palanca

$$gve1 = 0.469$$

Como se utilizo la regla de la palanca para determinar el factor de distribución este debe ser afectado por el factor presencia múltiple de 1.2 tomado de la tabla 3.6.1.1.2-1

Number of Loaded Lanes	Multiple Presence Factors, <i>m</i>
1	1.20
2	1.00
3	0.85
>3	0.65

$$gve1 = 0.563$$

Factor de distribución dos carriles cargado (gv2) Tabla 4.6.2.23b-1

$$g = e g_{interior}$$

$$e = 0.6 + \frac{d_e}{10}$$

$$e = 0.774$$

$$gve2 = 0.634$$

Debido al que el puente es esviado el factor de distribución "g" para cortante de la viga debe reducido de acuerdo con la siguiente expresión:

$$1.0 + 0.20 \left(\frac{12.0 L_t^3}{K_g} \right)^{0.3} \tan \theta$$

$$frv = 1.00$$

Factor de distribución de diseño (gv)

$$gve = 0.634$$

3.4.2.4. Cálculo de momentos y cortante por el teorema de Barret – VGE

Para facilitar el análisis y posterior evaluación de los índices de sobre esfuerzo en las vigas, esta fueron dividadas en toda su longitud en veinte

espacios iguales, obteniendo así 21 puntos donde se calcularon las solicitaciones y deformaciones. En la siguiente figura se presenta la división de la viga y la numeración de los puntos para el análisis.

Figura 39 Numeración puntos para el análisis de las vigas – Puente 1.

Fuente: Elaboración propia

Las solicitaciones en la viga externa se calcularon con las combinaciones que se definieron en el capítulo 1.6.7 de este documento, y los factores de distribución calculados para esta viga. En las siguientes tablas se presentan los valores de momentos y cortantes para la viga en estudio.

3.4.2.5. Cálculo de momentos y cortantes con SAP2000

Para realizar una verificación de los resultados de momentos y cortantes actuantes en las vigas obtenidos manualmente, estos mismos elementos se analizaron con la ayuda del programa SAP2000, elaborando un modelo matemático con elementos tipo frame en 3D, asignado las mismas cargas, combinaciones, geometría, dimensiones y materiales con que se analizaron manualmente. En las siguientes tablas se presentan los resultados obtenidos para las combinaciones de resistencia únicamente, combinaciones en las que se espera obtener los índices de sobre esfuerzo más altos.

3.4.2.6. Comparación resultados obtenidos con teorema de Barret vs SAP2000 –VGE.

En las siguientes figuras se presenta la superposición de las solicitaciones obtenidas con las combinaciones de resistencia, por el teorema de Barret (línea azul) versus las obtenidas con la ayuda del programa SAP2000 (línea roja), tarea que se realizó para verificar los valores de momentos y cortantes obtenidos manualmente (Teorema de Barret).

Fuente: Elaboración propia.

Figura 43 Diagrama de momento combinación resistencia 1-2 Barret vs SAP2000.

Fuente: Elaboración propia

De acuerdo a las figuras anteriores se presentan algunas diferencias de los valores en algunos puntos de la viga, pero en general los valores máximos de momentos y cortantes coinciden en los calculados por las dos metodologías sin embargo, los índices de sobre esfuerzo se calcularon con los datos obtenidos con la ayuda del programa SAP2000, esto para aprovechar la envolvente de solicitaciones que genera el programa.

3.4.2.7. Refuerzo suministrado a viga- VGE

El refuerzo de la viga se determinó con gran dificultad dada la antigüedad del puente y la poca legibilidad de la información registrada en los planos de diseño (Véase Figura 44 a Figura 46), sin embargo se logró extraer el refuerzo que se presenta en la Figura 47, Figura 48 y Figura 49.

3.4.2.8. Momento resistente “Mn” y cortante resistente “Vn” en viga VGE

Los momentos y cortantes resistentes se calcularon de acuerdo a la geometría de la viga, especificaciones de materiales y refuerzo suministrado, empleando las ecuaciones que se presentan en los numerales 1.6.8 y 1.6.9 de este documento.

Los momentos resistentes en la viga se calcularon en los corte 1-1, corte 2-2 y corte 3-3 que se indican en la Figura 48, de acuerdo con la configuración del refuerzo suministrado en la viga.

Dado que el corte 1-1 se localiza en la zona del apoyo, se debe afectar el valor de la resistencia a fluencia del acero de refuerzo, en la zona donde se desarrolla la longitud de anclaje de las barras de acero, además se consideró el aporte a la resistencia a cortante del elemento de las barras principales que presentan un dobles cerca al apoyo (barras de color morado y azul en la figura 48). A continuación se presentan los cálculos.

3.4.2.9. Índices de sobre esfuerzo por momentos y cortantes

Antes de calcular los índices de sobre esfuerzo se verifica que la viga cumpla con las dimensiones mínimas recomendadas en la norma, la cual indica que para vigas tipo T simplemente apoyadas el límite es $0,070 \cdot L$

- Luz Puente = 466 in
 - $h = 466 \cdot 0,070$
 - $h = 32,62$ in

De acuerdo con la información suministrada la altura de las vigas es de 28 in $<$ 32.62 in, lo que indica que no cumple con la altura mínima recomendada en la norma. En la siguiente imagen se presenta las dimensiones de la viga tomada de los planos de diseño y esta misma información transcritas en AutoCAD.

Figura 50 Revisión dimensiones viga

Fuente: Elaboración propia.

Los índices de sobre esfuerzo se presentan de dos formas diferentes:

1. La primera en tablas resaltando en color rojo los índices que sobrepasan el 100% de capacidad de la viga así como su localización.
2. Representación gráfica. (La línea roja representa la capacidad del elemento y las líneas azules representan las solicitaciones por corte y momento actuantes en el elemento).

3.4.2.10. Chequeo de deformaciones

El chequeo de deformaciones se realizó con el momento de inercia efectivo del elemento, tal como se recomienda en la norma. A continuación se presentan los cálculos.

Materiales

f'c= 14 Mpa = 292.6 kips/ft²
 fy= 420 Mpa = 60.9 kips/ft²
 Es= 200000 Mpa = 367.543 kips/ft²

Geometría viga

bfs= 1.73 m = 5.7 ft
 e= 0.18 m = 0.6 ft
 bv= 0.52 m = 1.7 ft
 h= 0.71 m = 2.3 ft
 dv= 0.57 m = 1.9 ft
 Rec = 0.08 m = 0.2 ft

Propiedades

Barras = 10
 # = 10
 As = 0.008 m² = 0.09 ft² Area de refuerzo suministrado en punto de estudio
 n= 11.14 Relación modular
 n*As = 0.091 = 0.98 ft²
 X= 0.18 m = 0.6 ft Distancia del eje centroidal

Momento de inercia efectivo

$$I_e = \left(\frac{M_{cr}}{M_a} \right)^3 I_g + \left[1 - \left(\frac{M_{cr}}{M_a} \right)^3 \right] I_{cr} \leq I_g$$

lg= 0.026 m⁴ = 3.0 ft⁴
 yt = 0.45 m = 52.5 ft⁴ Distancia dese el eje neutro a la fibra extrema a tracción
 fr = 2320 kN/m² Modulo de rotura del concreto
 M_{cr} = 132 kN-m = 97 kips-ft Momento de fisuración
 M_a = 577 kN-m = 426 kips-ft Momento en el concreto para la cual se calcula la deformación
 I_{cr} = 0.017 m⁴ = 2.0 ft⁴ Momento de inercia de la sección transformada
 I_e = 0.0173 m⁴ = 2.0 ft⁴ Momento de inercia efectivo

Tabla 24 Revisión deflexiones viga VGE

TABLE: Joint Displacements								
Joint	OutputCase	CaseType	StepType	U3		Δmax = L/800		Cumple

3.4.3 Análisis viga interna (VGI)

El análisis de la viga interior se realizó aplicando la misma secuencia empleada en la viga externa, por tal razón a continuación se presentan los cálculos, omitiendo algunos pasos que se presentaron en el análisis de la viga anterior

3.4.3.1. Cargas muertas “DC” y “DW” - VGI

Tabla 25 Evaluación de cargas muertas para viga interior - VGI.

Fuente: Elaboración propia.

3.4.3.2. Cargas vivas “L”

El análisis de la viga interior se analizó, con las cargas generadas por el camión de diseño HL-93, el tándem de diseño y la línea de carga, tal como se indica en el numeral 1.6.5.2 de este documento.

3.4.3.3. Factores de distribución para momento y cortante –

VGI.

Factor de distribución para momento - VGI

bf=	2.41 m	= 7.91ft Ancho efectivo
bf/2=	1.21 m	= 3.95 ft
b=	0.52 m	= 1.71ft Base
t=	0.18 m	= 0.59 ft Espesor de la placa

3.4.3.7. Refuerzo suministrado a viga -VGI

Según planos de diseño las vigas internas presentan el mismo refuerzo de las vigas externas que se presentó en el capítulo 3.4.2.7

3.4.3.8. Momento y cortante resistente - VGI

Los momentos y cortantes resistentes se calcularon de acuerdo a la geometría de la viga, especificaciones de materiales y refuerzo suministrado. Empleando las ecuaciones que se presentan en los numerales 1.6.8 y 1.6.9 de este documento.

Los momentos resistentes en la viga, se calcularon en los corte 1-1, corte 2-2 y corte 3-3 que se indican en la Figura 48. A continuación se presentan los cálculos.

Resistencia nominal a flexión Mn corte 1-1 - VGI			
Lon-d=	0.86m = 2.8 ft	Longitud de desarrollo barras	
Materiales			
f'c=	14 Mpa = 292.4	kips/ft ²	
fy=	420 Mpa = 8771.9	kips/ft ²	
fy=	287.45 Mpa = 6003.4	kips/ft ²	Afectado
Es=	2E+07 Mpa = 417708685.5	kips/ft ²	
Geometría viga			
bfs=	2.41m = 7.9 ft		
bv=	0.52m = 1.7 ft		
H=	0.71m = 2.3 ft		
dv=	0.62m = 2.0 ft		
Rec =	0.07m = 0.2 ft		
Cuantía de refuerzo suministrado			
Ref-prin=	1-1/4"	Diámetro de refuerzo para flexión	
Ash=	40cm ² = 6.15 ft ²	Área total de refuerzo para flexión	
ρ =	0.00317	Cuantía de refuerzo a flexión	
Resistencia nominal a flexión			
c =	As*fy / .85*f'c*b*β1	5.7.3.12-4 AASTHO	β1= 0.85 Para concretos menores a 28MPa 5.7.2.2
c =	0.05m = 0.2 ft	Profundidad del bloque de compresiones	
a=	ρ*d*fy / .85 * f'c		
a=	0.05m = 0.2 ft		
Mn=	φ*As*fy*(d-a/2)	5.7.3.2 AASTHO - Resistencia a flexión	φ = 0.9 5.5.4.2 AASTHO
Mn=	612 kN-m = 451.7 kips-ft		

Resistencia nominal a flexión Mn corte 2-2 VCI

Materiales
 $f'c = 14 \text{ Mpa} = 292.6 \text{ kips/ft}^2$
 $f_y = 420 \text{ Mpa} = 60.9 \text{ kips/ft}^2$

3.4.3.9. Índices de sobre esfuerzo para momentos y cortantes viga – VGI

La viga interna presenta la misma altura que la viga exterior, por lo tanto esta no cumple con las recomendaciones mínimas de altura de la norma.

Los índices de sobre esfuerzo de la viga interna se presentan de la misma forma que la viga externa; en tablas y representación gráfica.

Tabla 32 Índices de sobre esfuerzo por corte combinación servicio 1-1 VGI

3.4.3.10. Chequeo de deformaciones – VGI

El chequeo de deformaciones se realizó con el momento de inercia efectivo del elemento, tal como se recomienda en la norma. A continuación se presentan los cálculos.

Materiales

f'c= 14 Mpa = 292.6 kips/ft²
 fy= 420 Mpa = 60.9 kips/ft²
 Es= 200000 Mpa = 367.543 kips/ft²

Geometría viga

bfs= 2.41 m = 7.9 ft
 e= 0.18 m = 0.6 ft
 bv= 0.52 m = 1.7 ft
 h= 0.71 m = 2.3 ft
 dv= 0.57 m = 1.9 ft
 Rec = 0.08 m = 0.2 ft

Propiedades

Barras = 10
 # = 10
 As = 0.008 m² = 0.09 ft² Área de refuerzo suministrado en punto de estudio
 n= 11.14 Relación modular
 n*As = 0.091 = 0.98 ft²
 X= 0.18 m = 0.6 ft Distancia del eje centroidal

Momento de inercia efectivo

$$I_e = \left(\frac{M_{cr}}{M_a} \right)^3 I_g + \left[1 - \left(\frac{M_{cr}}{M_a} \right)^3 \right] I_{cr} \leq I_g$$

lg= 0.026 m⁴ = 3.0 ft⁴
 yt = 0.45 m = 52.5 ft⁴ Distancia dese el eje neutro a la fibra extrema a tracción
 fr = 2320 kN/m² Modulo de rotura del concreto
 M_{cr} = 132 kN-m = 97 kips-ft Momento de fisuración
 M_a = 577 kN-m = 426 kips-ft Momento en el concreto para la cual se calcula la deformación
 I_{cr} = 0.019 m⁴ = 2.2 ft⁴ Momento de inercia de la sección transformada
 I_e = 0.0186 m⁴ = 2.2 ft⁴ Momento de inercia efectivo

3.5. Análisis puente No 2

Dada la tipología del puente “tipo losa” con refuerzo principal paralelo al tráfico, la norma recomienda en el capítulo 4.6.2.1 analizar el puente por el método de las franjas, por tal razón y por la simetría del puente respecto a su eje longitudinal se determinaron y analizaron dos franjas; externa e interna respectivamente, para cargas verticales únicamente, esto por no contar con información de geotecnia y parámetros sísmicos. Las franjas se analizaron siguiendo la secuencia que se presenta a continuación:

1. Definición ancho de franja
2. Evaluación de cargas
3. Calculo de solicitaciones manualmente (líneas de influencia)
4. Calculo de solicitaciones con ayuda del SAP2000
5. Comparación de solicitaciones calculadas manualmente Vs SAP2000
6. Calculo de los índices de sobre esfuerzo por momento y cortante en la superestructura
7. Chequeo de deformaciones

3.5.1 Materiales Puente No 2

De acuerdo con la información suministrada la superestructura del puente fue diseñada con concreto clase “F” y acero de refuerzo PDR 60, a continuación se presentan las propiedades de estos materiales con que se analizara el puente.

- Concreto estructural clase “F”:
 - Resistencia mínima a la compresión, $f'c$ = 14,0 MPa
= 2030 PSI
 - Módulo de Elasticidad, E_c = 17.585,8 MPa
= 2550487PSI
- Acero de refuerzo:
 - Esfuerzo de fluencia, f_y = 420 MPa

$$= 60 \text{ ksi}$$

- Módulo de Elasticidad, $E_s = 200.000 \text{ MPa}$
 $= 29000 \text{ ksi}.$

3.5.2 Análisis franja externa - FEX

La longitud de la franja externa se determinó de acuerdo a las recomendaciones dadas en la norma, para puentes con luces mayores a 4,50 m. A continuación se presentan los cálculos:

Calculo ancho de franja externa - FEX

De acuerdo con el artículo 4.6.2.1.4 b se debe tomar el ancho de franja equivalente el menor valor entre :

1. E_{int} = Ancho de granja para un carril cargado
2. E_{borde} = Ancho de borde
3. E_{max} = Ancho máximo

1. E_{int}

$$E = 10.0 + 5.0 \sqrt{L_1 W_1}$$

$$W_1 = 9.0 \text{ m} = 29.5 \text{ ft}$$

$$L_1 = 18.0 \text{ m} = 59.1 \text{ ft}$$

$$E = 5.6 \text{ m} = 18.4 \text{ ft}$$

$$2. E_{borde} = 2.1 \text{ m} = 6.9 \text{ ft}$$

$$3. E_{max} = 1.8 \text{ m} = 5.9 \text{ ft}$$

$$\text{Ancho de franja externa } \mathbf{1.8 \text{ m}} = 5.9 \text{ ft}$$

3.5.2.1. Cargas muertas “DC” y “DW”

Acorde con la sección 3.3.2 de la norma AASTHO 2012, el patrón de carga denominado DC corresponde al peso propio de los componentes estructurales y accesorios no estructurales, sin embargo la carpeta de rodadura que se indica en los planos pero que no se observa en las imágenes tomadas con ayuda del Google Earth, es considerada como un accesorio no estructural, debido a que hace parte integral e indispensable para el funcionamiento del puente, pero la cual puede ser removida sin afectar el funcionamiento del puente, pero puede ser altamente susceptible de cambios en el tiempo, por tal razón se clasifica dentro del grupo de cargas DW.

En la siguientes tablas se presenta el avalúo de cargas muertas para la viga franja externa - FEX

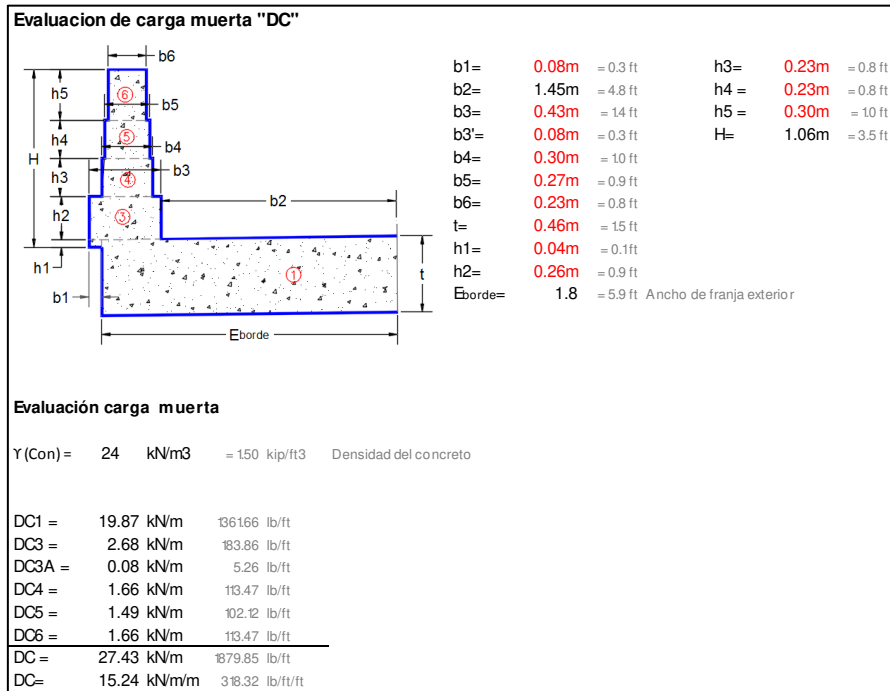

Tabla 41 Evaluación carga muerta franja exterior - FEX.

Fuente: Elaboración propia.

Tabla 42 Evaluación carga por carpeta de rodadura franja exterior - FEX.

Fuente: Elaboración propia.

3.5.2.2. Cargas vivas “L”

El puente se analizó con las cargas generadas por el camión de diseño HL-93, el tándem de diseño y la línea de carga, tal como se indica en el numeral 1.6.5.2 de este documento.

3.5.2.3. Cálculo de momentos y cortantes por líneas de influencia - FEX

Para facilitar el análisis y posterior evaluación de los índices de sobre esfuerzo en las franjas, estas fueron divididas en toda su longitud en cincuenta (50) espacios iguales, obteniendo así cincuenta y un puntos (51) donde se obtendrán las solicitaciones y deflexiones. En la siguiente figura se presenta la división de las franjas y los puntos para el análisis.

Figura 71 Puntos de análisis para franjas – Puente 2

Fuente: Elaboración propia.

Las solicitaciones en la franja externa se obtuvieron para cargas verticales con las combinaciones que se definieron en el capítulo 1.6.7 de este documento. En las siguientes tablas se presentan los cálculos obtenidos aplicando el método de las líneas de influencia.

3.5.2.4. Cálculo de momentos y cortantes con SAP2000 - FEX

Para realizar una verificación de los resultados de momentos y cortantes actuantes en la franja obtenidos manualmente, este elemento se analizó con la ayuda del programa SAP2000, elaborando un modelo matemático con elementos tipo frame en 3D, asignado las cargas, combinaciones, geometría, dimensiones y materiales con que se analizaron manualmente.

En las siguientes tablas se presentan los resultados obtenidos, para las combinaciones de resistencia únicamente, combinaciones en las que se espera obtener los índices de sobre esfuerzo más altos.

Tabla 47 Cortantes y momentos combinación resistencia 1-1 SAP2000 – FEX

3.5.2.5. Comparación resultados líneas Vs SAP2000 –FEX

En las siguientes figuras se presenta la superposición de las solicitaciones obtenidas con las combinaciones de resistencia, por líneas de influencia (línea azul) versus las obtenidas con la ayuda del programa SAP2000 (línea roja), tarea que se realizó para verificar los valores numéricos de momentos y cortantes obtenidos manualmente (Líneas de influencia).

Figura 75 Diagrama de momento combinación resistencia 1-2 Línea vs SAP2000

Fuente: Elaboración propia.

De acuerdo a las figuras anteriores se presentan algunas diferencias de los valores en algunos puntos de la franja, pero en general los valores máximos de momentos y cortantes coinciden en los calculados por las dos metodologías sin embargo, los índices de sobre esfuerzo se calcularon con los datos obtenidos con la ayuda del programa SAP2000, esto para aprovechar la envolvente de solicitaciones que genera el programa.

3.5.2.6. Refuerzo suministrado a franja externa - FEX

El refuerzo de la franja exterior se determinó con gran dificultad dada la antigüedad del puente y la poca legibilidad de la información registrada en los planos de diseño (Véase Figura 76, Figura 77 y Figura 78), sin embargo se logró extraer el refuerzo que se presenta en la Figura 79 a Figura 87.

3.5.2.7. Momento “Mn” y cortante resistente “Vn”

Los momentos y cortantes resistentes se calcularon de acuerdo a la geometría de la franja externa, especificaciones de materiales y refuerzo suministrado, empleando las ecuaciones que se presentan en los numerales 1.6.8 y 1.6.9 de este documento.

Los momentos resistentes de la franja externa se calcularon en los cortes que se presentan en la Figura 80, estos para tener en cuenta los traslapes y distribución del refuerzo en el puente.

Dado que el corte 1-1 se localiza en la zona del apoyo, se debe afectar el valor de la resistencia a fluencia del acero de refuerzo, en la zona donde se desarrolla la longitud de anclaje de las barras de acero. A continuación se presentan los cálculos.

3.5.2.8. Índices de sobre esfuerzo por momentos y cortantes –

FEX

Antes de calcular los índices de sobre esfuerzo, se verifica que el espesor de la franja externa cumpla con las dimensiones mínimas recomendadas en la norma, la cual indica que para losas continuas el límite es $0,027 \cdot L > 6,5$ in

- Luz Máxima Puente = 450 in
 - $h = 450 \cdot 0,027$
 - $h = 12,15$ in

De acuerdo con la información suministrada la altura de la losa es de 18.1 in $> 12,15$ in, lo que indica que la losa cumple con la altura mínima recomendada por la norma. En la siguiente imagen se presenta las dimensiones de la losa tomada de los planos de diseño y la transcrita en AutoCAD.

Figura 88 Revisión dimensiones losa

Fuente: Elaboración propia.

Los índices de sobre esfuerzo que se presentan a continuación se calcularon con las solicitaciones obtenidas con ayuda del programa SAP200.

Los resultados se presentan de dos formas diferentes:

1. La primera en tablas, resaltando en color rojo los índices que sobrepasan el 100% de capacidad de la franja, así como su localización.
3. Representación gráfica. (La línea roja representa la capacidad del elemento y las líneas azules representan las solicitaciones por corte y momento actuantes en el elemento).

Dado que los índices de sobre esfuerzo por cortante, sobrepasan el 100 % cerca a los apoyos intermedios, se decide realizar una verificación de la capacidad a cortante de la placa, por el método del puntal tensor. A continuación se presentan los cálculos y la representación gráfica de los resultados.

Revisión a corte por el método del Puntal-Tensor
Elemento : Franja Externa Punto - 17

Geometría

h = 0.46m = 1.5 ft b1 = 1.8 = 5.9 ft Ancho de apoyo
 Rec = 0.06m = 0.2 ft
 d = 0.40m = 1.3 ft

Materiales

f'c = 14 Mpa = 2000 PSI

3.5.3 Análisis franja interna FIN

El análisis de la franja interna se realizó aplicando la misma secuencia empleada en la franja externa, por tal razón a continuación se presentan los cálculos, omitiendo algunos pasos que se presentaron en el análisis de la franja anterior

La longitud de la franja interna se determinó de acuerdo a las recomendaciones dadas en la norma para puente con luces mayores a 4,50 m. A continuación se presentan los cálculos:

Calculo ancho de franja interna - FIN

De acuerdo con el artículo 4.6.2.3 el ancho de franja equivalente para puentes con luces mayores a 14.46 ft (4,5m) se determina de la siguiente manera :

1. Para un carril cargado

$$E = 84.0 + 1.44\sqrt{L_1 W_1} \leq \frac{12.0W}{N_L}$$

W1= 9.0m = 29.5 ft

L1= 18.0m = 59.1 ft

Eint1= 5.6m = 18.4 ft

2. Para dos carriles cargados

W1= 12.5m = 41.0 ft

L1= 18.0m = 59.1 ft

$$E = 10.0 + 5.0\sqrt{L_1 W_1}$$

Eint2= 3.90m = 12.8 ft

3. Limite ancho de franja

Limite= 12*W/NL

W= 13.2m = 43.3 ft

NL= 2

Limite = 6.6

Ancho de franja Interna 3.90m = 12.8 ft

3.5.3.1. Cargas muertas "DC" y "DW"

Evaluacion carga muerta "DC" - FIN

b= 3.90m = 12.8 ft
t= 0.46m = 15 ft

Y(Con) = 24 kN/m³ = 150 kip/ft³ Densidad del concreto
DC = 11.04 kN/m = 0.76 kip/ft Peso propio

Evaluacion carga por carpeta de rodadura "DW" - FIN

b= 3.90m = 12.8 ft
e= 0.07m = 0.2 ft Espesor carpeta asfáltica

Y(Asf) = 22.5 kN/m³ = 140 kip/ft³ Densidad carpeta asfáltica
DW = 1.58 kN/m = 0.11 kip/ft Carpeta Asfáltica

3.5.3.2. Cargas vivas “L”

El análisis de la franja interior se analizó con las cargas generadas por el camión de diseño HL-93, el tándem de diseño y la línea de carga, tal como se indica en el numeral 1.6.5.2 de este documento.

3.5.3.3. Cálculo de momentos y cortantes por líneas de influencia

Para el análisis de la franja interior, esta se dividió de la misma forma que la franja exterior, calculando las solicitaciones en los puntos que se indican en la Figura 71. A continuación se presentan los cálculos.

Tabla 58 Cortantes y momentos combinación servicio 1-1 – FIN

3.5.3.7. Momento “Mn” y cortante resistente “Vn” -FIN

Los momentos y cortantes resistentes se calcularon de acuerdo a la geometría de la franja interior, especificaciones de materiales y refuerzo

suministrado, empleando las ecuaciones que se presentan en los numerales 1.6.8 y 1.6.9 de este documento.

Los momentos resistentes de la franja interior se calcularon en los cortes que se presentan en la Figura 71, esto para tener en cuenta traslapes y distribución de refuerzo.

Dado que el corte 1-1 se localiza en la zona del apoyo, se debe afectar el valor de la resistencia a fluencia del acero de refuerzo, en la zona donde se desarrolla la longitud de anclaje de las barras de acero. A continuación se presentan los cálculos.

Dado que los índices de sobre esfuerzo por cortante, sobrepasan el 100 % cerca a los apoyos intermedios, se decide realizar una verificación de la capacidad a cortante de la placa, por el método del puntal tensor. A

continuación se presenta los cálculos y la representación gráfica de los resultados.

Revisión a corte por el método del Puntal-Tensor

Elemento : Franja Interna Punto - 17

Geometría

h= 0.46m = 1.5 ft b1= 3.9 = 12.8 ft. Ancho de apoyo
 Rec = 0.06m = 0.2 ft
 d= 0.40m = 1.3 ft

Materiales

f'c= 14 Mpa = 2000 PSI
 fy= 420 Mpa = 59997 PSI

Esquema puntal - tensor

h1 = 0.34
 b3 = 0.57
 Angulo 30.82 ° Mayor a 22° - cumple, "Nocumple"
 Vu= 751 kN = 168.8 kips
 C= 699 kN = 157.1 kips
 T= 590 kN = 132.6 kips

Cuántia de refuerzo suministrado

Ref-prin= 26 # 8" Diámetro de refuerzo para flexión
 Ash= 133cm2 = 20.55 ft² Área de refuerzo a dv
 Ld= 0.00m = 2.8 ft Longitud de desarrollo barras
 fy= 420 Mpa = 59997 PSI fy-Afectado por Ld

Resistencia del tensor (T)

$P_u = \phi P_n = \phi f_y A_{st}$ $\phi = 1.00$
 $\phi P_n = 5569 \text{ kN} = 1252 \text{ kips}$ Refuerzo cumple > T Índice = 11%

Resistencia del puntal de compresión sin refuerzo (C)

$P_n = f_{cu} A_{cs}$ Donde ; $f_{cu} = \frac{f'_c}{0.8 + 170\epsilon_1} \leq 0.85 f'_c$ $\epsilon_1 = \epsilon_s + (\epsilon_s + 0.002) \cot^2 \alpha_s$

$\alpha_s = 30.82^\circ = 0.54 \text{ Rad}$ Menor Angulo entre el puntal de compresión y el tensores adyacentes de tracción
 $\cot(\alpha_s)^2 = 2.812$
 $\epsilon_s = 0.002$ Deformación unitaria de tracción en el concreto
 $\epsilon_1 = 0.01325$
 $f_{cu} = 4.6 \text{ MPa}$ Cumple
 $.85 f'_c = 11.9 \text{ MPa}$ Limite
 Barra # 1" = 25 mm Refuerzo para calculo Acs
 $6d_{ba} = 0.15m$
 $b\text{-Franja} = 1.80m$
 $A_{cs} = 0.55m^2$
 $\phi = 0.80$
 $\phi P_n = 2013 \text{ kN}$ Índice = 35%

Revisión a corte por el método del Puntal-Tensor

3.5.3.9. Chequeo de deformaciones

El chequeo de deformaciones se realizó con el momento de inercia efectivo del elemento, tal como se recomienda en la norma. A continuación se presentan los cálculos.

Momento de inercia efectivo corte 1-1

Materiales

f _c =	14 Mpa =	202.6	kips/ft ²
f _y =	420 Mpa =	60.9	kips/ft ²
E _s =	200000 Mpa =	367.543	kips/ft ²

Geometría viga

b _{fs} =	3.90 m	= 12.8 ft
e=	0.46 m	= 1.5 ft
b _v =	0.00 m	= 0.0 ft
h=	0.00 m	= 0.0 ft
d _v =	0.40 m	= 1.3 ft
Rec =	0.06 m	= 0.2 ft

Propiedades

Barras = 26

# =	8	
A _s =	0.013 m ²	= 0.14 ft ² Área de refuerzo suministrado en punto de estudio
n =	11.14	Relación modular
n*A _s =	0.148	= 1.59 ft ²
X =	0.20 m	= 0.7 ft Distancia del eje centroidal

Momento de inercia efectivo

$$I_e = \left(\frac{M_{cr}}{M_a} \right)^3 I_t + \left[1 - \left(\frac{M_{cr}}{M_a} \right)^3 \right] I_g \leq I_t$$

l _g =	0.032 m ⁴	= 3.7 ft ⁴
y _t =	0.23 m ⁴	= 26.6 ft ⁴ Distancia dese el eje neutro a la fibra extrema a tracción
f _r =	2320 kN/m ²	Modulo de rotura del concreto
M _{cr} =	319 kN-m	= 235 kips-ft Momento de fisuración
M _a =	266 kN-m	= 196 kips-ft Momento en el concreto para la cual se calcula la deformación
I _{cr} =	0.016 m ⁴	= 1.9 ft ⁴ Momento de inercia de la sección transformada
I _e =	0.0428 m ⁴	= 5.0 ft ⁴ Momento de inercia efectivo

Deflexión máxima por cargas permanentes

$$\delta = 5 * W * l^4 / 384 * E * I_e$$

W=	22 kN-m
L=	14.00 m
E=	17959955 kN/m ²
δ =	0.014 m

Capitulo IV

CONCLUSIONES

- Dado que el presente trabajo realizado fue netamente académico, no se realizaron trabajos de campo ni programación de ensayos en los puentes, necesarios para establecer las condiciones reales de conservación de cualquier estructura.
- Los resultados que se presentan en este informe, se calcularon con base en la información suministrada por la universidad de Purdue; la cual constaba de una copia de los planos originales de diseño y reparaciones realizadas a los puentes. Información que era poco legible y que debió ser confirmada con trabajos de campo, pero por tratarse un de trabajo académico no se realizó esta labor.
- Según las imágenes que se obtuvieron de los puentes, con la ayuda del programa Google Earth, los puentes siguen en servicio y a simple vista no se observan daños importantes en la superestructura de los mismos.
- De acuerdo a los resultados obtenidos, los índices de sobre esfuerzo por cortante y flexión del puente No 1, calculados con las combinaciones de servicio, no superan la capacidad de los elementos, aun cuando en estas combinaciones se está multiplicado la carga viva por 1.33% para tener en cuenta efectos dinámicos, tal como lo indica la norma.
- Los índices de sobre esfuerzo por flexión del puente No 1, con combinaciones de resistencia son superados hasta un máximo del 16% de la capacidad de las vigas en centro luz del puente.
- Si bien los índices por flexión son superados en el puente No – 1, además de no cumplir con los límites de deformaciones establecidos en la norma, esto no quiere decir que se deba reforzar el puente de manera inmediata, ya que el puente ha venido soportando las cargas de diseño sin mayorar, atravez de los años y a simple vista no se observan daños que puedan comprometer la integridad del sus componentes.
- Los índices de sobre esfuerzo por flexión y corte, con combinaciones de servicio y para el puente No 2, no superan la resistencia de los elementos.
- Los índices de sobre esfuerzo por flexión, con combinaciones de resistencia para el puente No 2, no superan la resistencia de los elementos.

- Los índices de sobre esfuerzo por corte, con combinaciones de resistencia para el puente No 2, superan hasta un 54% de la capacidad del elemento en zonas “D” cercanas a los apoyos intermedios, por tal razón se realizó un chequeo adicional a cortante empleando el método del puntal tensor, método que es permitido por la AASTHO 2012 para analizar las regiones “D” que tienen estados de esfuerzos muy complejos en los que no aplica la teoría de vigas.

Una vez realizado el chequeo por el método del puntal tensor, se observa que los elementos presentan una mayor capacidad de resistencia a cortante en las zonas cercanas a los apoyos que la calculada con la teoría de vigas, por lo tanto el puente No-2 cumple con los requerimientos de capacidad establecidos en la norma.

- Las deformaciones verticales del puente No- 2 no superan los límites establecidos en la norma.
- Si bien los puentes fueron diseñados y construidos hace ya casi 69 años el más antiguo, y estando cercanos a cumplir su vida útil es de admirar a los ingenieros estructurales que proyectaron estas estructuras, ya los puentes aún siguen en servicio, aun cuando con el paso de los años, las cargas vivas (Camión) han tenido grandes avance, tanto en su tecnología como en capacidad de carga.
- Si bien en el país se cuenta con la Norma Colombiana de Diseño de Puentes – LRFD – CCP14 y el manual para inspección visual de puentes y pontones del Instituto Nacional de Vías – INVIAS, no se cuenta con normativa para evaluación y reforzamiento de estructuras viales, por lo tanto es necesario que las entidades competentes revisen el tema, y dicten los lineamientos para desarrollar este tipo de trabajos en el país.

GENERAL NOTES

Depth of footing to be extended if found necessary. See Art. 8003 & 8004 of Specifications. Retaining wall covering shall be 1" in floor slab, 3" in footing, except below street which shall be 2" in concrete and 1" in masonry. All dimensions on details and drawings are in feet and inches unless noted. Concrete in footings, wingwalls, and abutments to be Class 40. Concrete in superstructure including abutments to be Class 40. Reinforcing steel to be under coatings, and change expansion edges 1 inch unless noted. Curbs must be cast with concrete. Flash with concrete. See Special Provisions for items included in this contract.

DESIGN DATA

Designed for HS-20-16 and loading in accordance with 1999 A.A.S.H.O. Specifications.

JOINT LEGEND

Joint 1/4" indicates a vertical joint in the concrete deck. All bridge expansion joints on vertical faces of concrete shall be of the reinforced concrete type. All bridge expansion joints on horizontal faces of concrete shall be of the reinforced concrete type. All bridge expansion joints on horizontal faces of concrete shall be of the reinforced concrete type.

TYPICAL CROSS SECTION

NOTE: THICKENED PAVEMENT ONLY TO BE USED ON SHOULDERS SLOPED AT 2:1. THICKENED PAVEMENT NOT TO BE USED BEYOND PROJECT LIMITS.

DESIGN DATA:
 Designed for +20.5 to +44' loading in accordance with 1957 AASHTO Specifications.

TYPICAL CROSS-SECTION:
 For typical cross-section see Sheet No. 3.
 For typical cross-section of approach see Sheet No. 4.
 E-11-1P (Completed July 1953).

JOINT LEGENDS:
 Joint 3 indicates 3' performed work filler under front 6'-0" side bearing area and one layer of medium weight roofing felt under bearing area.
 Joint 4 indicates 4' performed work filler placed longitudinally on each of the outer 5' portions of the bearing area with concrete to concrete bearing under the remaining portion.
 Each of the outer 5' portions of the pier bearing area is originally an medium weight roofing felt under remainder of bearing area.
 1'-0" at set at Sta. C.

GENERAL NOTES:
 No present structure at proposed S.B. Lane bridge site.
 Design of footings to be made if found necessary. See A-1.
 Piers shall have structural walls.
 Determine pile lengths by Art. 203 of Specifications.
 For details of steel encased concrete piers see S.D. Sta. C; the concrete shall be placed in accordance with Specifications.
 Piers shall be driven to elevation shown on plans or depth, if necessary, to obtain desired bearing.
 Footings occur below water level, which shall be 4' and 2' in all other parts, unless noted.
 Concrete in footings and pier stems to bottom of coping to be placed in superstructure, including railing, bent caps, top of pier above bottom of coping to be class "C".
 Concrete piles encased concrete piers shall be placed in 25 ft. Continuous concrete piers shall be required between coast.
 All steel piers to be encased; chamfer exposed edges 1" unless noted.
 Roadway drainage outlets to be placed as shown on this drawing in position of pile head minimum 2".
 Expansion joint to be placed in approach pavement approximately 100' from bridge.
 All railings to be constructed monolithic to grade.
 Railings & Posts are aluminum. See S.D. Sta. A.

PHASE II

NOTE:
Traffic to be restricted during daylight hours only on Structure 3570A (Northbound) See Road Sid. Sheet 1 Details.
Bituminous Widening of southbound structure was placed in Contract R19523. (U.S. 31 Reconstruction, Letting July, 1991)
2 Signs Type X220-5 to be placed as directed by the Engineer.

SHEET: 2 OF 30
DESIGNED BY: *George P. ...*

GENERAL NOTES

Plans for these structures are on file in the Central Office, INDOT at Bridge the base 31-80-3570 and 31-80-3570U and are available upon request.

Where new work is to be fitted to old work, the contractor shall be responsible for the proper fit and shall be responsible for any errors or omissions to the engineer and assume responsibility for their correctness and the fit of the new part to the old.

The hand chipping and cleaning of deteriorated concrete areas shall be as directed by the Engineer. It is the intent of these plans that the contractor shall be responsible for the removal of all loose material and shall continue until PERFECTLY SOUND CONCRETE is exposed. All existing non-fall depth patches shall be removed.

Concrete in patches for deteriorated concrete areas, up to the milled surface, is to be Bridge Deck Finishing Concrete. Concrete up to an epoxy bonding compound or Modified Portland Cement Concrete.

All bituminous material required in this contract is to be Type I or II, except for the use of Bituminous Material For Lock Coat" in Sp.

The length and quantity of Bituminous wedge and leveling shown is based on the use of Modified Portland Cement Concrete Overlay. See the "Special Provisions".

Reinforcing steel covering shall be 1" in the top and 1" minimum in the bottom of the floor slab and 2" in all other parts, unless noted.

Concrete in railing is to be Class "C".

All exposed edges shall be chamfered 1" unless noted.

Surface Seal coats, all faces of concrete railings, and face of coping for Structure 3570A only. Est. Quantity = 1,880 Sq. Yds.

All Guard Rail removed to remain the property of the contractor (Type, both Structures).

Remove existing bituminous surface on bridge and resurface. Match existing profile.

Place revetment riprap over geotextiles as shown. (Estimated quantity = 113 tons Revetment Riprap & 150 yds. Geotextile).

Remove railing and section and construct new concrete railing transition. See drawing 35.

LEGEND

- ① Remove existing bituminous surface on bridge and resurface. Match existing profile.
- ② Place revetment riprap over geotextiles as shown. (Estimated quantity = 113 tons Revetment Riprap & 150 yds. Geotextile).
- ③ Remove railing and section and construct new concrete railing transition. See drawing 35.

Indicates limits of Revetment Riprap

Structure built to a +0.357% Grade

LEGEND

- 1 Remove existing slab form concrete parapet and raise height of parapet to 2'-6". See Dwg. R5.
- 2 Remove existing approach slabs and construct new 10" R.C. slabs. New slabs to be tied to bridge deck. See Dwg. R4.
- 3 Remove 4'-9" at ends of existing parapet and reconstruct to provide standard rail connection. See Dwg. R5.
- 4 Surface mill patch and overlay deck with a modeling or dense portland cement concrete overlay to a level 1/2" above original deck surface. (Est. Paving 1,570 Sft.)
- 5 Place revestment riprap as shown to provide erosion protection at Pier No. 2 and Pier No. 3.
- 6 Break up existing concrete sidewalks and place revestment riprap as shown.

Indicates Project Riprap (To be left for as Structure Removal, Portland)

Indicates limits of Existing Riprap over Concrete and 20" Type Reinforcement Riprap & 328 Sys. Geotextile
